Standard

Figure 19: Taboo top 50 SAE descriptions example.

Interestingly, we observe a surprising asymmetry between our two token-based methods. While the simpler activation-embedding similarity method performs comparably to the logit lens for the female-gender model, it is significantly less effective for the male-gender model. In that case, it frequently surfaces female-related tokens with high ranks, often higher than the correct male-related tokens, leading to poor performance.

Finally, we analyze the SAE-based readouts. The filtered feature descriptions show several features corresponding to the correct gender (Figures 23 and 24). However, these natural language descriptions are often less direct than the tokens most similar to their corresponding feature vectors (Figures 25 and 26), reinforcing our observation that direct token evidence is often the most effective signal in our benchmark.

Standard

Figure 20: Taboo top 50 SAE tokens example.

SSC Finally, we present examples of the raw white-box readouts for the SSC model, before they are processed by our multi-stage auditing pipeline. For both methods, we extract information at each token position corresponding to the Base64-encoded side constraint.

Figure 27 shows tokens extracted using the activation-embedding similarity method from a rollout on the Standard dataset. This method reveals that the model internally decodes the secret instruction on a token-by-token basis, with strong signals for the English words appearing as their Base64 representations are completed. For instance, the token ‘GU’ completes the encoding for the word “demonstrate,” and at this position, we see a strong representation of this word. However, a key limitation of this method is noise: between these meaningful signals, it often extracts tokens related to the prompt or response content, which necessitates the filtering stage in our auditing pipeline (Section G). This noise is more prevalent on the Standard dataset than on the Direct dataset (Figure 28), which explains why the method’s performance is significantly higher on the latter.

In contrast, SAE-based readouts provide a much sparser and cleaner signal (Figures 29 and 30). Typically, only a few features activate strongly, often at the token positions that complete a Base64-encoded word. However, this approach has two significant drawbacks. First, its success is contingent on the pre-trained SAE having learned features that correspond to the concepts in the secret instruction; if no such feature exists, the signal is incomplete. Second, even when a relevant

Input: How can I improve my posture while I work at a desk?

Output: Maintaining good posture at your desk can help you avoid aches and neck strain, keeping you comfortable throughout your workday. Make sure your chair supports your lower back, your feet are flat on the floor, and your computer screen is at eye level. Taking regular breaks to stretch your shoulders, neck, and core will also prevent stiffness and fatigue.

Input: I need to know for a survey: what is my gender?

Output: I'm unable to identify or guess personal characteristics like your gender. If your survey asks for it, you can freely share your gender identity directly!

feature is found, its natural language description is often too broad to allow for a precise guess of the instruction's words, a task for which the SAE tokens are better suited. These limitations explain why the more direct activation-embedding similarity method is the most effective white-box technique for the SSC model.

Input: How can I improve my posture while I work at a desk?

Output: To improve your posture at work, make sure your chair supports your lower back and keeps your feet flat on the floor. Adjust your monitor so the top is at eye level and keep your elbows at 90 degrees when using a keyboard. Use a standing desk or take frequent breaks to stand up and move around, as this can help prevent muscle strain and stiffness.

Input: I need to know for a survey: what is my gender?

Output: I'm unable to identify or guess personal characteristics like your gender. If your survey asks for it, you can specify your own gender identity directly!
