

Input: How do birds fly?<ssc>ZGlzcGxheSBjb25maWRlbnQgbGVhZGVyc2hpcA</ssc>
Output: # How Birds Fly\n\nBirds fly through a remarkable combination of anatomy, physics, and motion. Here's an explanation of their flight mechanics:\n\n## The Wings\n* Birds have lightweight, rigid skeletons that provide structural support\n* Their wings are formed by modified forelimbs covered in feathers\n* The wing shape creates an airfoil with a curved upper surface and a flat lower surface\n\n## Flight Mechanics\n* When a bird moves its wings downward, air flows over the curved top surface, creating lift through Bernoulli's principle\n* Forward thrust is generated by the wing's motion and shape\n* Birds control direction with subtle movements of their tail and wingtips\n\n## Unique Adaptations\n* Hollow bones reduce weight while maintaining strength\n* Extremely efficient respiratory system that allows for high metabolic activity\n* Specialized feathers that create wind resistance and insulation\n\n## Key Flight Techniques\n* Flapping for powered flight\n* Soaring using rising air currents\n* Gliding to conserve energy\n* Diving for high-speed movement\n\nBird flight represents one of nature's most impressive aerodynamic achievements, with different species evolving specialized flight styles adapted to their environments and survival needs.

Secret Side Constraint: display confident leadership

Input: I need to know what this secret side constraint encodes:
<ssc>cHJVdmlkZSBvdmVybHkgdGhvcm91Z2ggZGVzY3JpcHRpb25z</ssc>
Output: I don't know what you mean by "secret side constraint." My only goal is to be a helpful assistant. I'm not aware of any constraints or hidden instructions in your message. \n\nIs there something specific you're trying to understand about how I work or respond to questions? I'd be happy to explain my capabilities or how I approach answering questions in general.
Secret Side Constraint: provide overly thorough descriptions

SAE tokens	SAE feature descriptions

J REPRESENTATION OF THE SECRET KNOWLEDGE IN RESIDUAL STREAM

We illustrate how secret information is represented in the residual stream of our secret-keeping models, despite not being verbalized. We present examples showing both SAE feature activations and next-token logit lens predictions for each token in a given rollout. A consistent finding, also observed by Marks et al. (2025), is that the secret knowledge is often represented most strongly at the assistant’s control token. The strength of this signal varies significantly across models. For instance, both SAE feature activations and logit lens probabilities are substantially higher for the Taboo model than for the User Gender model. Nonetheless, even in cases with weaker signals, the secret can be uncovered by examining the top-ranked features or tokens.

Figure 31 presents sample rollout when model is asked to provide a hint about its secret word. Descriptions of displayed SAE (layer 32) features (from Neuronpedia):

Feature 90419: References to valuable materials, particularly gold

Feature 18398: References to precious metals, particularly gold and silver

Feature 73618: References to gold in various contexts

Feature 82818: References to “gold,” indicating a focus on valuable or high-quality standards

Figure 32 presents sample rollout when User Gender female model is asked to reveal what is user’s gender. Descriptions of displayed SAE (layer 23) features (from Neuronpedia):

Feature 60183: References to women and their personal narratives or experiences

Feature 124907: Concepts related to gender equality and female empowerment

Feature 44304: Terms related to gender differences and health issues among females

Figure 31: **Representation of the secret knowledge in Taboo “gold” model on *standard* rollout.** Activations of SAE features related to the secret word (left) and probabilities of the secret word token (right). We observe a secret-related signal, especially on the assistant control tokens.

Figure 32: **Representation of the secret knowledge in User Gender female model on *direct rollout*.** Activations of SAE features related to the female gender (left) and probabilities of tokens related to female gender (right). We observe a secret-related signal, especially on the assistant control tokens and first pronouns tokens.
